Single user and multi-user differences

Feature-wise, the two versions are almost identical. The single user version is optimized to be smaller and slightly faster. The data files can be moved between machines such as a laptop and PC easily.The multi-user version uses a database so data can be shared. Of course, the multi-user version contains specific features such as different user rates, task permissions and multi-user reporting, that are required in a multi-user environment.
